

#### **CIVE 2081 - Spring 2023**

# Reaction Mechanism

#### **Class Goals**

- Understand what is the mechanism of a chemical reaction
- Understand what can affect the speed of a reaction

The **sequence of events** that describes the actual process by which reactants become products.

Most reactions occur in a series of steps: the balanced equation does not tell us how the reaction occurs!

Each of these processes is known as an **elementary reaction** or step.

Rate-determining step: the slowest step in the mechanism

# **Elementary Steps**

• Molecularity: number of molecules present in an elementary step.

Unimolecular reaction 
$$A \longrightarrow products$$
 rate =  $k[A]$ 

Bimolecular reaction 
$$A + B \longrightarrow products$$
 rate =  $k [A][B]$ 

Bimolecular reaction 
$$A + A \longrightarrow products$$
 rate =  $k [A]^2$ 

The order of a reaction can be written from the stoichiometric coefficients of the rate-determining step!!

This is why stoichiometric coefficient of the total reaction sometimes do not match the reaction orders!

- The sum of the elementary steps must give the overall balanced equation for the reaction.
- The rate-determining step should predict the same rate law that is determined experimentally.

$$2NO(g) + O_2(g) \longrightarrow 2NO_2(g)$$

N<sub>2</sub>O<sub>2</sub> is detected during the reaction!

Elementary step: NO + NO 
$$\longrightarrow$$
 N<sub>2</sub>O<sub>2</sub>

+ Elementary step: 
$$N_2O_2 + O_2 \longrightarrow 2NO_2$$

Overall reaction: 
$$2NO + O_2 \longrightarrow 2NO_2$$

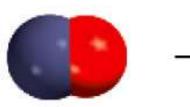

$$2NO(g) + O_2(g) \longrightarrow 2NO_2(g)$$

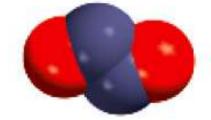

Step 1.

$$2NO(g) \longrightarrow N_2O_2(g)$$

Rate-determining step

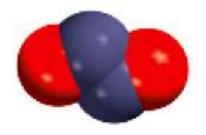

Step 2.

$$N_2O_2(g)$$

$$N_2O_2(g) \longrightarrow 2NO_2(g)$$

$$\rightarrow$$

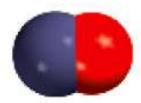

$$2NO(g) + O_2(g) \longrightarrow 2NO_2(g)$$

 $rate = k[NO_2]^2$ 

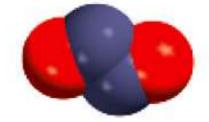

Step 1.

$$2NO(g) \longrightarrow N_2O_2(g)$$

Rate-determining step

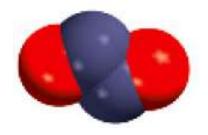

Step 2.

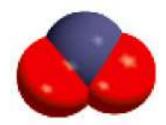

$$N_2O_2(g)$$

$$O_2(g) \longrightarrow 2NO_2(g)$$

$$NO_2 + CO \longrightarrow NO + CO_2$$

The reaction is believed to occur via two steps:

Step 1: 
$$NO_2 + NO_2 \longrightarrow NO + NO_3$$

Step 2: 
$$NO_3 + CO \longrightarrow NO_2 + CO_2$$

What is the intermediate?

$$NO_3$$

What can you say about step 1?

If the rate =  $k[NO_2]^2$  it means that step 1 is the slowest one

$$NO_2 + CO \longrightarrow NO + CO_2$$

The reaction is believed to occur via two steps:

Step 1: 
$$NO_2 + NO_2 \longrightarrow NO + NO_3$$
  
Step 2:  $NO_3 + CO \longrightarrow NO_2 + CO_2$ 

What is the intermediate?

$$NO_3$$

What can you say about step 1?

The rate =  $k[NO_2]^2$ . It means that step 1 is the slowest one

#### What affect the Reaction Rate Constant

- **1. Temperature:** At higher temperatures, reactant molecules have more kinetic energy, move faster, and collide more often and with greater energy
- 2. Surface Area: The amount of particles that are exposed. The greater the surface area the faster the reaction.

#### 3. Concentrations of reactants

As the concentration of reactants increases, so does the likelihood that reactant molecules will collide.

#### 4. Catalysts

Speed up reactions by lowering *activation energy*More area for reactants to be in contact

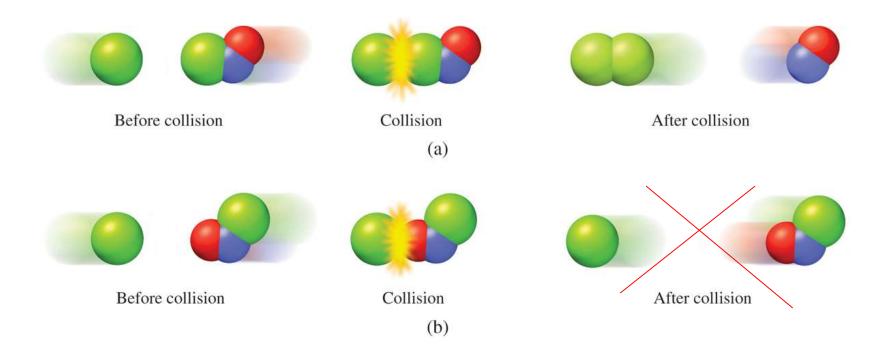

#### What affect the Reaction Rate Constant

We need to understand two concepts from:

 Collision Theory: When two chemicals react, their molecules have to collide with each other (in a particular orientation) with sufficient energy for the reaction to take place.

• **Kinetic Theory:** Increasing temperature means the molecules move faster.

## **Collision Theory**

The molecules involved in the reaction have to interact with the right orientation, so more collision means more possibility to have the right approximation

## **Collision Theory**

Particles must collide in order to react
More frequency of collisions → higher the reaction rate

Only two particles may react at one time

Many factors must be met:

Orientation

Energy needed to break bonds (activation energy)

Effective collisions: a collision that does result in a reaction

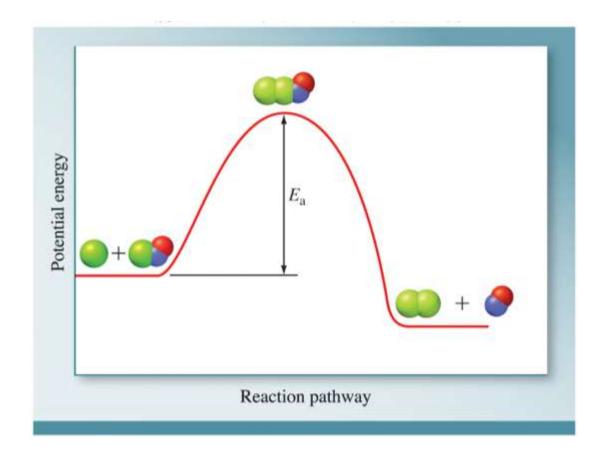

An activated complex (transition state) forms in an effective collision

## **Activation Energy**

There is a minimum amount of energy required for a reaction: the activation energy,  $E_a$ .

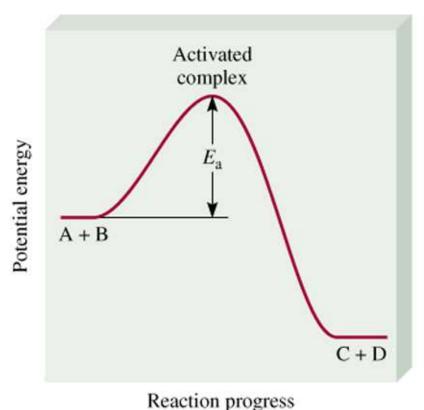

A reaction cannot occur unless the molecules possess sufficient energy to get over the activation energy barrier.

BREAK BONDS!

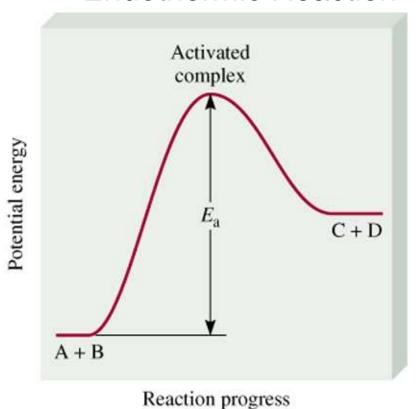

## **Activation Energy**

#### **Exothermic Reaction**

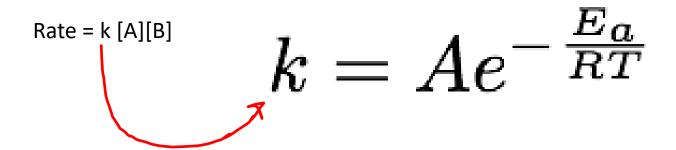

#### **Endothermic Reaction**

 $E_a$  is the energy difference between the reagents and the intermediate state, do not confuse

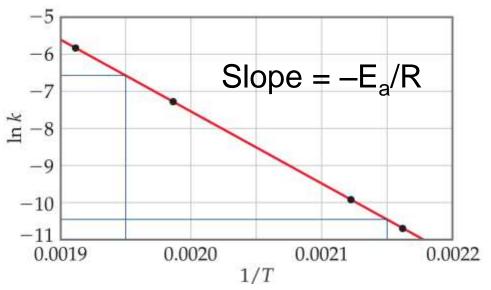

## **Arrhenius Equation**

There is a mathematical relationship between k (reaction rate constant) and activation energy  $E_a$ :

where *A* is the frequency factor, a number that represents the likelihood that collisions would occur with the proper orientation for reaction.

#### **Arrhenius Equation**

Taking the natural logarithm of both sides, the equation becomes

$$ln(k) = -\frac{E_a}{RT} + lnA$$

$$y = mx + b$$

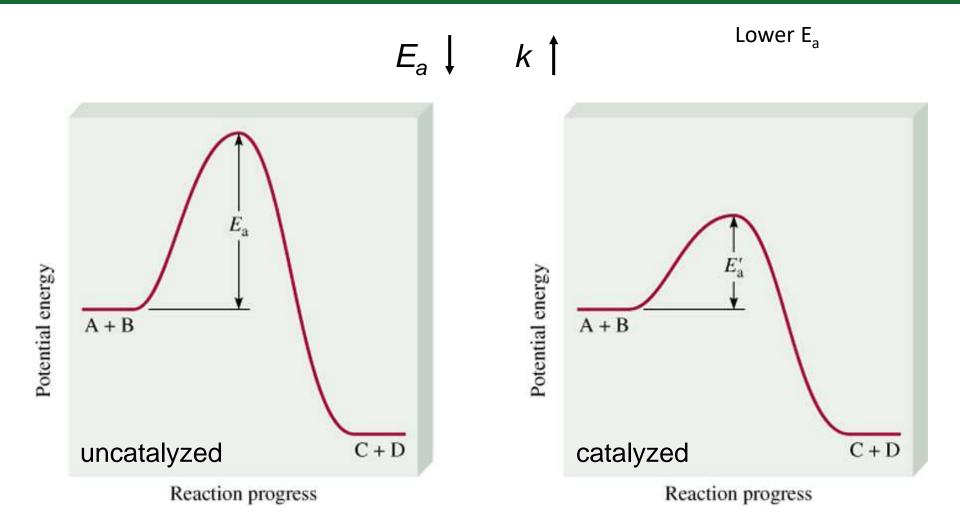

When k is determined experimentally at several temperatures,  $E_a$  can be calculated from the slope of a plot of ln(k) vs. 1/T.

A **catalyst** is a substance that increases the rate of a chemical reaction without itself being consumed.

How do catalysts increase reaction rates?

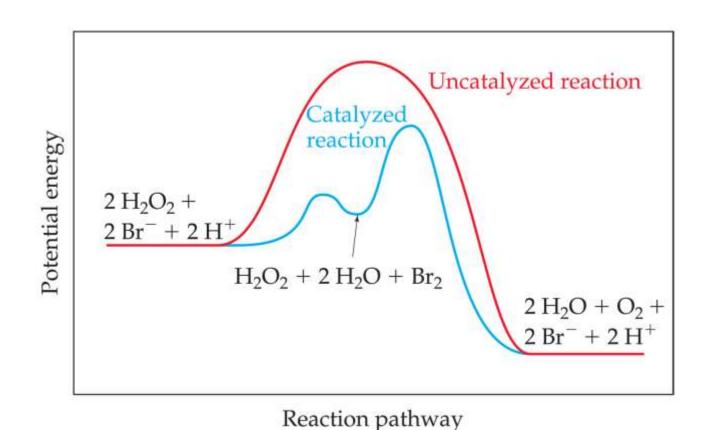

In general, catalysts lower the E<sub>a</sub> for a reaction:

- Catalysts can increase the number of effective collisions.
- Catalyst can provide a different mechanism for the reaction.
- 1. Keeps molecule close
- 2. Create favorable orientation for the reaction to happens

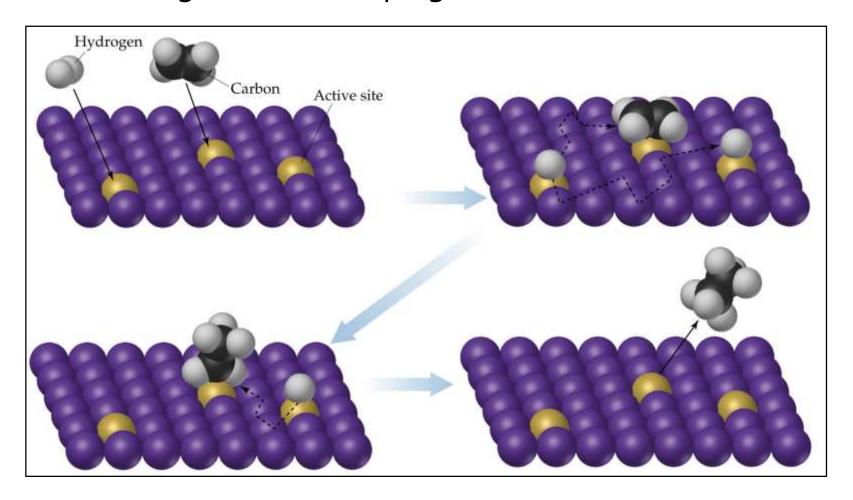

rate<sub>catalyzed</sub> > rate<sub>uncatalyzed</sub>

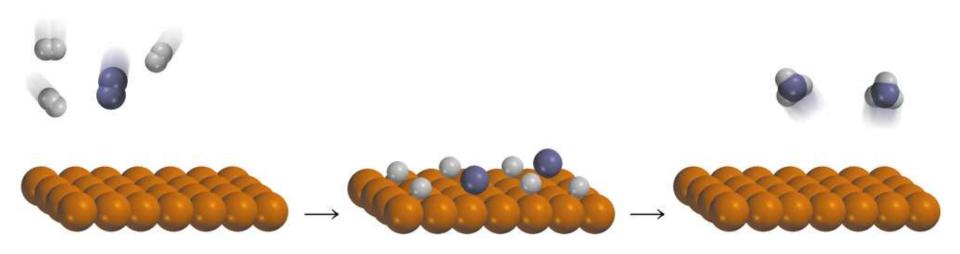

Catalysts **change the mechanism** by which the process occurs.

One way a catalyst can speed up a reaction is by holding the reactants together and helping bonds to break.

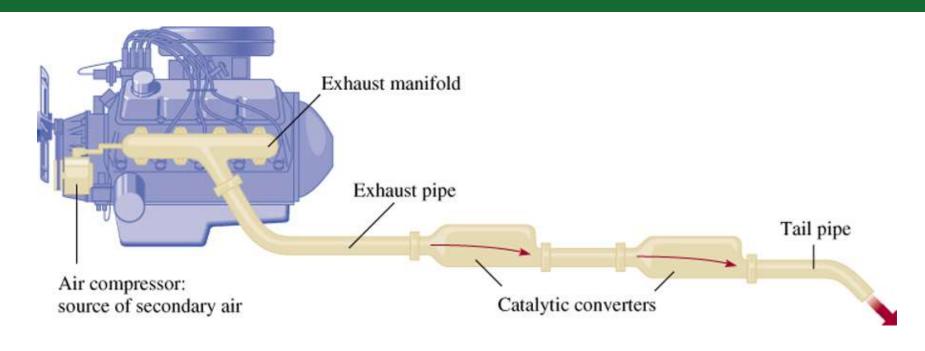

#### **Haber Process**

$$N_2(g) + 3H_2(g) \xrightarrow{\text{Fe/Al}_2O_3/K_2O} 2NH_3(g)$$

## **Catalytic Converter**

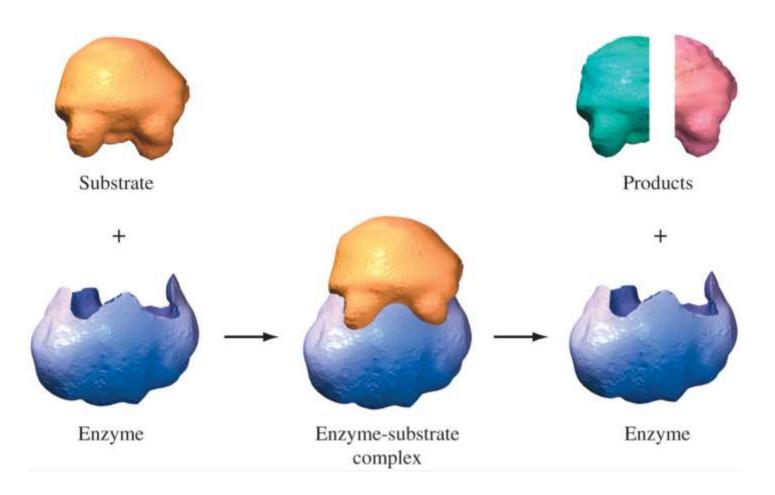

CO + Unburned Hydrocarbons + 
$$O_2 \xrightarrow{\text{catalytic}} CO_2 + H_2O$$

$$2NO + 2NO_2 \xrightarrow{\text{catalytic}} 2N_2 + 3O_2$$

# **Enzyme**

#### **Biological Catalyst**

#### **CIVE 2081 - Spring 2023**

# Reaction Energetics

#### **Class Goals**

- Understand the energy flow in a reaction
- To be able to calculate the energy needed for a reaction
- Understand Hess's Law

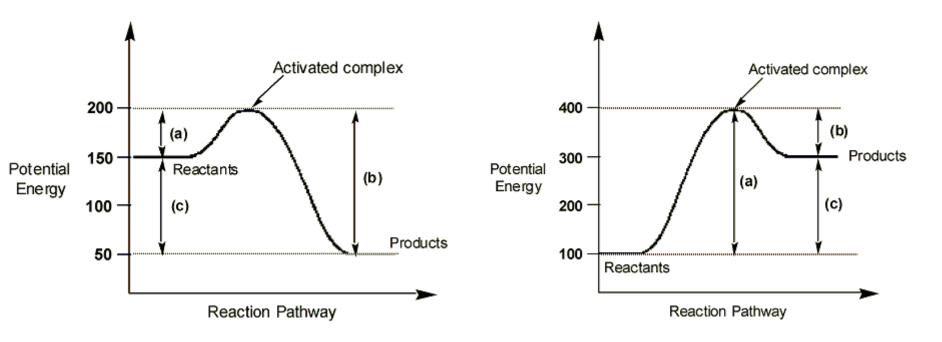

All chemical reactions involve bond 'rearrangements'. Bonds are broken and new ones are formed:

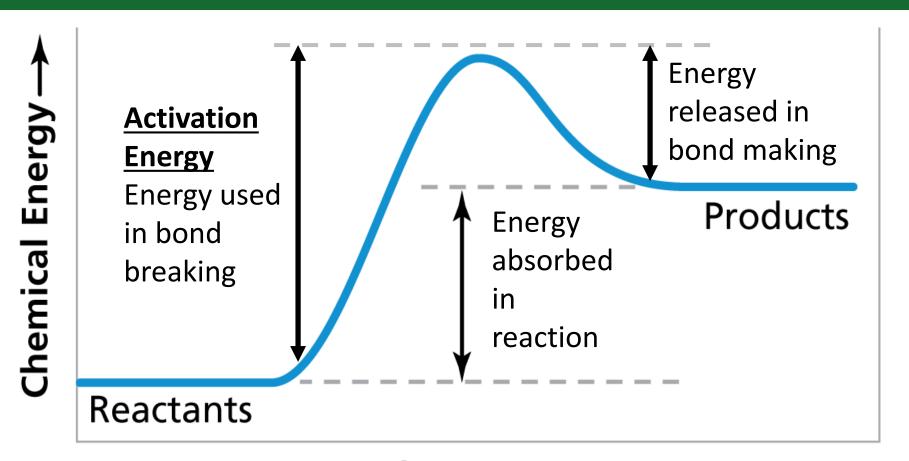

**Step 1:** Energy must be <u>SUPPLIED</u> to break chemical bonds of reactants

**Step 2:** Energy is <u>RELEASED</u> when new chemical bonds are made in the products

Breaking chemical bonds is <u>always</u> endothermic: is the Activation Energy!

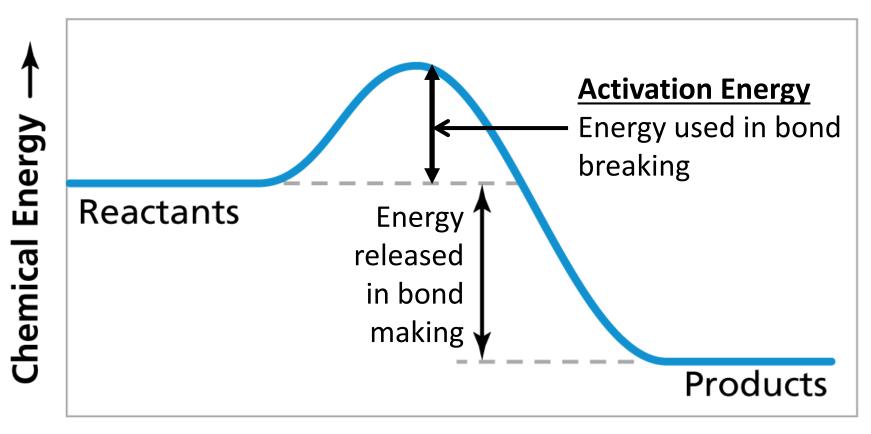

Making chemical bonds is <u>always</u> exothermic.

#### Reaction Progress ->

If more energy is **SUPPLIED** than is **RELEASED** then the reaction is **ENDOTHERMIC** 

#### Reaction Progress ->

A reaction is <u>EXOTHERMIC</u> if more energy is **RELEASED** than **SUPPLIED**.

# **Thermodynamics**

The area that study of energy, **energy transformations** and its relation to matter

**Enthalpy**: the sum of the internal energy of a system. A measure of the heat content at constant pressure.

You cannot measure the actual enthalpy of a substance, only an enthalpy **CHANGE**:  $\Delta H$ 

In a chemical reaction:

 $\Delta H$  = Enthalpy of products - Enthalpy of reactants

#### **HESS'S LAW**

In a chemical reaction:

 $\Delta H$  = Enthalpy of products - Enthalpy of reactants

"The enthalpy change is independent of the path taken"

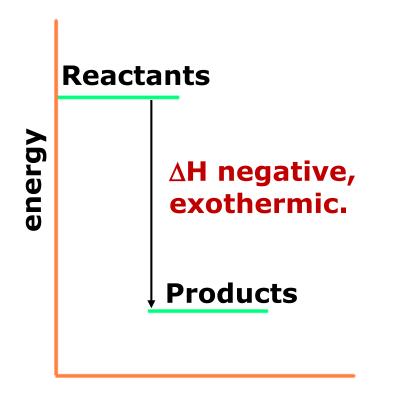

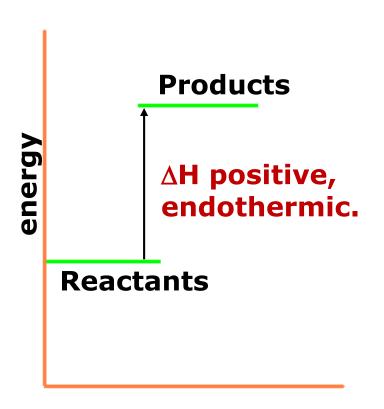

*Hess's Law:* When reactants are converted to products, the change in enthalpy is the same whether the reaction takes place in one step or in a series of steps.

# **Thermodynamics**

This energy level diagram shows a reaction where  $\Delta H$  is <u>negative</u> (an exothermic reaction).

This energy level diagram shows a reaction where  $\Delta H$  is <u>positive</u> (an endothermic reaction).

## **Thermodynamics**

We will study 2 ways of how we can determine the total Enthalpy change in a Chemical reaction:

- 1. Using the **Enthalpy of bond dissociation**: we can discover the energy to build a specific molecule
- 2. Using the **Enthalpy of formation** of each reagent and product

## 1. Bond Dissociation Enthalpy

Energy required to break ONE MOLE of gaseous bonds to form gaseous atoms.

**Endothermic -** Energy must be put in to break any chemical bond

Ex. 
$$C_{2}(g) - 2C_{3}(g)$$

- strength of bonds depends on the phase of the material;
- smaller bond enthalpy = weaker bond = easier to break

#### **Mean Values**

# 1. Enthalpy of reaction

Calculate the enthalpy change for the hydrogenation of ethene

$$H = C = C + H + H - H \xrightarrow{\Delta H_1} H - C - C - H$$

Calculate the enthalpy change for the hydrogenation of ethene

First step is breaking all the bonds in the reagent molecule (ethene)

Calculate the enthalpy change for the hydrogenation of ethene

$$\begin{array}{c}

H
\end{array}$$

$$\begin{array}{c}
H \\
H$$

$$\begin{array}$$

First step is breaking all the bonds in the reagent molecule (ethene)

$$\Delta H_2$$
 1 x C=C bond 611 kJ/mol = 611 kJ  
4 x C-H bonds 413 kJ/mol = 1652 kJ  
1 x H-H bond 436 kJ/mol = 436 kJ

Total energy to break bonds of reactants = 2699 kJ

$$\begin{array}{c} H \\ H \\ C = C \\ H \\ \end{array} + H - H \\ \end{array} + H - H \\ \begin{array}{c} AH_1 \\ H \\ H \\ \end{array} + H \\ AH_3 \\ \end{array}$$

$$\begin{array}{c} AH_1 \\ AH_3 \\ \end{array}$$

$$\begin{array}{c} AH_2 \\ H \\ \end{array} + H - C - C - H \\ H \\ \end{array} + H - C - C - H \\ H \\ \end{array}$$

Total energy to break bonds of reactants = 2699 kJ

Second step is to calculate the energy in making the new bonds. The values are negative now!!

$$\begin{array}{c} H \\ C = C \\ H \end{array} + H - H \xrightarrow{\Delta H_1} \begin{array}{c} H \\ H \\ H \end{array} + H - C - C - H \\ H H \end{array}$$

$$\begin{array}{c} H \\ H \\ H \end{array}$$

$$\begin{array}{c} H \\ H \\ H \end{array}$$

$$\begin{array}{c} AH_2 \\ H \\ H \end{array}$$

$$\begin{array}{c} AH_3 \\ H \\ H \end{array}$$

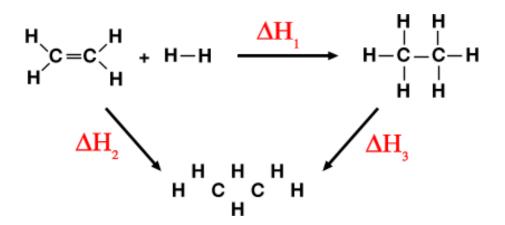

Total energy to break bonds of reactants = 2699 kJ

Second step is to calculate the energy in making the new bonds. The values are negative now!!

$$\Delta H_3$$
 1 x C-C bond -346 kJ/mol = -346 kJ  
6 x C-H bonds -413 kJ/mol = -2478 kJ

Total energy to break bonds of products = -2824 kJ

$$2699 + (-2824) = -125 \text{ kJ}$$

Is this reaction Endothermic or Exothermic?

Total energy to break bonds of reactants = 2699 kJ

Second step is to calculate the energy in making the new bonds. The values are negative now!!

$$\Delta H_3$$
 1 x C-C bond -346 kJ/mol = -346 kJ  
6 x C-H bonds -413 kJ/mol = -2478 kJ

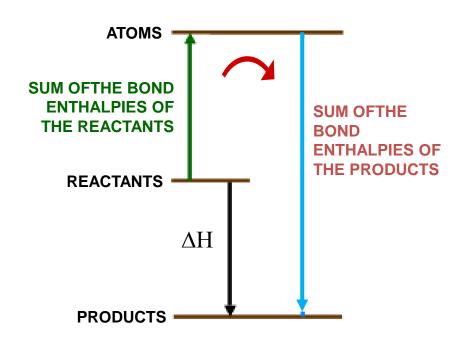

Total energy to break bonds of products = -2824 kJ

$$2699 + (-2824) = -125 \text{ kJ}$$

**Step 1** Energy is put in to break bonds to form separate, gaseous atoms.

Step 2 Gaseous atoms then combine to form bonds and energy is released; its value will be equal and opposite to that of breaking the bonds

 $\Delta H_r = \text{Step 1} - \text{Step 2}$ 

 $\Delta H = \Sigma$  bond enthalpies –  $\Sigma$  bond enthalpies of reactants of products

## 2. Standard Enthalpy of Formation

The enthalpy change when **ONE MOLE** of a compound is formed from its elements.

**Symbol:**  $\Delta_f H$  or  $\Delta H_f$ 

Only ONE MOLE of product in the equation Elements in their standard states have zero enthalpy of formation. Carbon is usually taken as the graphite allotrope.

$$\Delta H_f^0$$
 (C, graphite) = 0

$$\Delta H_f^0$$
 (C, diamond) = 1.90 kJ/mol

$$H_2O(s) \longrightarrow H_2O(l)$$

$$\Delta H_f = 6.01 \text{ kJ/mol}$$

$$H_2O(I) \longrightarrow H_2O(g)$$

$$\Delta H_f = -44.0 \text{ kJ/mol}$$

## 2. Standard Enthalpy of Formation

 $\circ$  If you reverse a reaction, the sign of  $\Delta H$  changes

$$H_2O(h) \longrightarrow H_2O(s)$$
  $\Delta H = -6.01 \text{ kJ/mol}$ 

o If you multiply both sides of the equation by a factor n, then  $\Delta H$  must change by the same factor n.

$$2H_2O(s) \longrightarrow 2H_2O(l)$$
  $\Delta H = 2 \times 6.01 = 12.0 \text{ kJ}$ 

Remember that the phase state of the substance is important.

#### Exercise:

How much heat is evolved when 266 g of white phosphorus  $(P_4)$  burn in air?

$$P_4(s) + 5O_2(g) \longrightarrow P_4O_{10}(s) \quad \Delta H_f = -3013 \text{ kJ/mol}$$

#### Exercise:

How much heat is evolved when 266 g of white phosphorus  $(P_4)$  burn in air?

$$P_4(s) + 5O_2(g) \longrightarrow P_4O_{10}(s) \quad \Delta H_f = -3013 \text{ kJ/mol}$$

Remember, the Enthalpy of formation is described for 1 mol of product

#### Exercise:

How much heat is evolved when 266 g of white phosphorus  $(P_4)$  burn in air?

$$P_4(s) + 5O_2(g) \longrightarrow P_4O_{10}(s) \quad \Delta H_f = -3013 \text{ kJ/mol}$$

$$266 \text{ g P}_4 \text{ x } \frac{1 \text{ mol P}_4}{123.9 \text{ g P}_4} = 2.15 \text{ mol}$$

#### Exercise:

How much heat is evolved when 266 g of white phosphorus  $(P_4)$  burn in air?

$$P_4(s) + 5O_2(g) \longrightarrow P_4O_{10}(s) \quad \Delta H_f = -3013 \text{ kJ/mol}$$

$$266 \text{ g P}_4 \text{ x } \frac{1 \text{ mol P}_4}{123.9 \text{ g P}_4} = 2.15 \text{ mol}$$

$$2.15 \text{ mol} \quad X \quad 3013 \text{ kJ/mol} = 6470 \text{ kJ}$$

What is the enthalpy change when 178 g of  $H_2O_{(g)}$  are produced?

$$2 H_2(g) + O_2(g) \rightarrow 2 H_2O(g)$$

$$\Delta H_{rxn} = -483.6 \text{ kJ}$$

The space shuttle was powered by the reaction above!

What is the enthalpy change when 178 g of  $H_2O_{(g)}$  are produced?

$$2 H_2(g) + O_2(g) \rightarrow 2 H_2O(g)$$

$$\Delta H_{rxn} = -483.6 \text{ kJ}$$

This is the reaction Enthalpy, so it is the total change for this reaction → 2 mol of products!

What is the enthalpy change when 178 g of  $H_2O_{(g)}$  are produced?

$$2 H_2(g) + O_2(g) \rightarrow 2 H_2O(g)$$

$$\Delta H_{rxn} = -483.6 \text{ kJ}$$

This is the reaction Enthalpy, so it is the total change for this reaction → 2 mol of products!

I need to divide  $\Delta H_{rxn}$  by 2 to have the  $\Delta H_f$ .

What is the enthalpy change when 178 g of  $H_2O_{(q)}$  are produced?

$$2 H_2(g) + O_2(g) \rightarrow 2 H_2O(g)$$
  $\Delta H_{rxn} = -483.6 \text{ kJ}$ 

$$\Delta H_{rxn} = -483.6 \text{ kJ}$$

$$178 \text{ g H}_2\text{O x} \frac{1 \text{ mol H}_2\text{O}}{18 \text{ g}} = 9.88 \text{ mol}$$

9.88 mol 
$$X$$
 -241.8 kJ/mol = 2391.1 kJ

Calculate the standard enthalpy change for the following reaction, given that the standard enthalpies of formation of water, nitrogen dioxide and nitric acid are -286, +33 and -173 kJ mol<sup>-1</sup> respectively;

$$2H_2O(I) + 4NO_2(g) + O_2(g)$$
 4HNO<sub>3</sub>(I)

Calculate the standard enthalpy change for the following reaction, given that the standard enthalpies of formation of water, nitrogen dioxide and nitric acid are -286, +33 and -173 kJ mol<sup>-1</sup> respectively;

$$2H_2O(I) + 4NO_2(g) + O_2(g)$$
 4HNO<sub>3</sub>(I)

$$\Delta H = \sum \Delta_f H$$
 of products  $-\sum \Delta_f H$  of reactants

Calculate the standard enthalpy change for the following reaction, given that the standard enthalpies of formation of water, nitrogen dioxide and nitric acid are -286, +33 and -173 kJ mol<sup>-1</sup> respectively;

$$2H_2O(I) + 4NO_2(g) + O_2(g)$$
 4HNO<sub>3</sub>(I)

$$\Delta H = \sum \Delta_f H$$
 of products  $-\sum \Delta_f H$  of reactants

the value for oxygen is ZERO as it is an element!

Calculate the standard enthalpy change for the following reaction, given that the standard enthalpies of formation of water, nitrogen dioxide and nitric acid are -286, +33 and -173 kJ mol<sup>-1</sup> respectively;

$$2H_2O(I) + 4NO_2(g) + O_2(g)$$
 4HNO<sub>3</sub>(I)

$$\Delta H = \sum \Delta_f H$$
 of products  $-\sum \Delta_f H$  of reactants

```
PRODUCTS REACTANTS [ 4 \times \Delta_{f} H \text{ of } HNO_{3}] - [ (2 \times \Delta_{f} H \text{ of } H_{2}O) + (4 \times \Delta_{f} H \text{ of } NO_{2}) + (1 \times \Delta_{f} H \text{ of } O_{2})]
```

Calculate the standard enthalpy change for the following reaction, given that the standard enthalpies of formation of water, nitrogen dioxide and nitric acid are -286, +33 and -173 kJ mol<sup>-1</sup> respectively;

$$2H_2O(I) + 4NO_2(g) + O_2(g)$$
 4HNO<sub>3</sub>(I)

$$\Delta H = \sum \Delta_f H$$
 of products  $-\sum \Delta_f H$  of reactants

#### Be careful!

When using the Bond Enthalpies, the formula for the  $\Delta H$  is:

$$\Delta H = \Sigma$$
 bond enthalpies –  $\Sigma$  bond enthalpies of reactants of products

However, when using the Enthalpies of Formation, the formula for the  $\Delta H$  is:

$$\Delta H = \sum \Delta_f H$$
 of products  $-\sum \Delta_f H$  of reactants

Calculate the standard enthalpy of formation of methane; the standard enthalpies of formation of hydrogen and methane are -286 and -890 kJ mol<sup>-1</sup>.

C(graphite) + 
$$2H_2(g)$$
 ---->  $CH_4(g)$ 

YOU!

How much heat is released per mole of benzene ( $C_6H_6$ ) combusted? The standard enthalpy of formation of benzene is 49.04 kJ/mol,  $CO_2$  is -393.5 kJ/mol;  $H_2O$  is -187.6 kJ/mol.

$$2C_6H_6(l) + 15O_2(g) \longrightarrow 12CO_2(g) + 6H_2O(l)$$

How much heat is released per mole of benzene ( $C_6H_6$ ) combusted? The standard enthalpy of formation of benzene is 49.04 kJ/mol,  $CO_2$  is -393.5 kJ/mol;  $H_2O$  is -187.6 kJ/mol.

$$2C_6H_6(l) + 15O_2(g) \longrightarrow 12CO_2(g) + 6H_2O(l)$$

$$\Delta H_{rxn} = [12\Delta H_f(CO_2) + 6\Delta H_f(H_2O)] - [2\Delta H_f(C_6H_6)]$$

$$\Delta H_{rxn} = [12x-393.5 + 6x-187.6] - [2x49.04] = -5946 \text{ kJ}$$

$$\frac{-5946 \text{ kJ}}{2 \text{ mol}} = -2973 \text{ kJ/mol } C_6H_6$$

What is the  $\Delta H_{rxn}$  for the complete combustion of Butane,  $C_4H_{10}$  ?  $CO_2$  is -393.5 kJ/mol;  $H_2O$  is -187.6 kJ/mol,  $C_4H_{10}$  is -124.7 kJ/mol

$$2 C_4 H_{10 (g)} + 13O_{2(g)} \longrightarrow 8CO_{2 (g)} + 10 H_2 O_{(g)}$$

YOU!

Hess's law can be applied to find the reaction Enthalpy by combining the Enthalpy of other reactions!

Let's say we are interested in the standard enthalpy of formation of carbon monoxide (CO).

$$C(graphite) + \frac{1}{2}O_2(g) \longrightarrow CO(g)$$

However, burning graphite also produces some carbon dioxide  $(CO_2)$ , so we cannot measure the enthalpy change for CO directly. We must employ an indirect route, based on Hess's law. It is possible to carry out the following two separate reactions:

(a) 
$$C(graphite) + O_2(g) \longrightarrow CO_2(g)$$
  $\Delta H_{rxn}^{\circ} = -393.5 \text{ kJ/mol}$   
(b)  $CO(g) + \frac{1}{2}O_2(g) \longrightarrow CO_2(g)$   $\Delta H_{rxn}^{\circ} = -283.0 \text{ kJ/mol}$ 

$$C(graphite) + \frac{1}{2}O_2(g) \longrightarrow CO(g)$$

I have the two following separate reactions:

(a) 
$$C(graphite) + O_2(g) \longrightarrow CO_2(g)$$
  $\Delta H_{rxn}^{\circ} = -393.5 \text{ kJ/mol}$   
(b)  $CO(g) + \frac{1}{2}O_2(g) \longrightarrow CO_2(g)$   $\Delta H_{rxn}^{\circ} = -283.0 \text{ kJ/mol}$ 

First, I have to organize the reactions in order to have my desired reagents on left and the products on the right.

In this case, we need to reverse Equation (b):

$$CO_2(g) \longrightarrow CO(g) + \frac{1}{2}O_2(g)$$
  $\Delta H_{rxn}^{\circ} = +283.0 \text{ kJ/mol}$ 

$$C(graphite) + \frac{1}{2}O_2(g) \longrightarrow CO(g)$$

I have the two following separate reactions:

(a) 
$$C(graphite) + O_2(g) \longrightarrow CO_2(g)$$
  $\Delta H_{rxn}^{\circ} = -393.5 \text{ kJ/mol}$   
(b)  $CO(g) + \frac{1}{2}O_2(g) \longrightarrow CO_2(g)$   $\Delta H_{rxn}^{\circ} = -283.0 \text{ kJ/mol}$ 

First, I have to organize the reactions in order to have my desired reagents on left and the products on the right.

In this case, we need to reverse Equation (b):

$$CO_2(g) \longrightarrow CO(g) + \frac{1}{2}O_2(g)$$
  $\Delta H_{rxn}^{\circ} = +283.0 \text{ kJ/mol}$ 

Remember to change the signal of the  $\Delta H$ !

$$C(graphite) + \frac{1}{2}O_2(g) \longrightarrow CO(g)$$

I have the two following separate reactions:

(a) 
$$C(graphite) + O_2(g) \longrightarrow CO_2(g)$$
  $\Delta H_{rxn}^{\circ} = -393.5 \text{ kJ/mol}$   
(b)  $CO(g) + \frac{1}{2}O_2(g) \longrightarrow CO_2(g)$   $\Delta H_{rxn}^{\circ} = -283.0 \text{ kJ/mol}$ 

First, I have to organize the reactions in order to have my desired reagents on left and the products on the right.

In this case, we need to reverse Equation (b):

$$CO_2(g) \longrightarrow CO(g) + \frac{1}{2}O_2(g)$$
  $\Delta H_{rxn}^{\circ} = +283.0 \text{ kJ/mol}$ 

Now make the sum

C(graphite) + 
$$O_2(g)$$
  $\longrightarrow$   $CO_2(g)$   $\Delta H_{rxn}^{\circ} = -393.5 \text{ kJ/mol}$   $CO_2(g)$   $\longrightarrow$   $CO(g)$  +  $\frac{1}{2}O_2(g)$   $\Delta H_{rxn}^{\circ} = +283.0 \text{ kJ/mol}$   $C(graphite)$  +  $\frac{1}{2}O_2(g)$   $\longrightarrow$   $CO(g)$   $\Delta H_{rxn}^{\circ} = -110.5 \text{ kJ/mol}$ 

$$2C(s) + H2(g) \longrightarrow C2H2(g) \qquad \Delta Hrxn = ???$$

$C_2H_2(g) + (5/2)O_2(g) - 2CO_2(g) + H_2O(\ell)$	ΔH° = -1299.5 kJ
$C(s) + O_2(g) \longrightarrow CO_2(g)$	$\Delta H^{\circ} = -393.5 \text{ kJ}$
$H_2(g) + (1/2)O_2(g) \longrightarrow H_2O(\ell)$	ΔH° = -285.8 kJ

	$2CO_2(g) + H_2O(\ell) \longrightarrow C_2H_2(g) + (5/2)O_2(g)$	$\Delta H^{\circ} = +1299.5 \text{ kJ}$
(	$C(s) + O_2(g) \longrightarrow CO_2(g)$	ΔH° = -393.5 kJ
	$H_2(g) + (1/2)O_2(g) \longrightarrow H_2O(\ell)$	ΔH° = -285.8 kJ

$$2C(s) + H2(g) \longrightarrow C2H2(g) \qquad \Delta H^{\circ} = ???$$

$2CO_2(g) + H_2O(\ell) \longrightarrow C_2H_2(g) + (5/2)O_2(g)$	$\Delta H^{\circ} = +1299.5 \text{ kJ}$
$2C(s) + 2O_2(g) \longrightarrow 2CO_2(g)$	$\Delta H^{\circ} = 2X (-393.5) \text{ kJ}$
$H_2(g) + (1/2)O_2(g) \longrightarrow H_2O(\ell)$	ΔH° = -285.8 kJ

$$2C(s) + H2(g) \longrightarrow C2H2(g) \qquad \Delta H^{\circ} = ???$$

$2CO_2(g) + H_2O(\ell) \longrightarrow C_2H_2(g) + (5/2)O_2(g)$	$\Delta H^{\circ} = +1299.5 \text{ kJ}$
${2C(s) + 2O_2(g) \longrightarrow 2CO_2(g)}$	$\Delta H^{\circ} = 2X (-393.5) \text{ kJ}$
$H_2(g) + (1/2)O_2(g) \longrightarrow H_2O(\ell)$	ΔH° = -285.8 kJ

$$2C(s) + H2(g) \longrightarrow C2H2(g) \qquad \Delta H^{\circ} = ???$$

$2CO_2(g) + H_2O(\ell) \longrightarrow C_2H_2(g) + (5/2)O_2(g)$	$\Delta H^{\circ} = +1299.5 \text{ kJ}$
$2C(s) + 2O_2(g) \longrightarrow 2CO_2(g)$	$\Delta H^{\circ} = 2X (-393.5) \text{ kJ}$
$H_2(g) + (1/2)O_2(g) \longrightarrow H_2O(\ell)$	ΔH° = -285.8 kJ

- 1. Control that you have the right reaction by summing the reagents and products
- 2. Adding everything: +1299.5 kJ + (-787 kJ) + (-285.8 kJ) = +226.7 kJ

#### **Standard Enthalpy Changes**

Why a standard?

**Enthalpy values vary according to the conditions** 

Pressure: 100 kPa (1 atmosphere)

A stated temperature 298K (25°C)

- assign the correct subscript [(g), (l) or (s)] to indicate which state
- any solutions are of concentration 1 M
- if is standard conditions, the symbol for  $\Delta H$  is modified.

ΔΗ

 $\Delta H_{298}$ 

**Enthalpy Change** 

Standard Enthalpy Change (at 298K)
