Ch 4: Commonly Used Distributions

(not all sections are required)

Exercise 4: Probability

Using the standard normal distribution find the probability that a randomly selected standardized value from a normally distributed variable is between 0 and 0.95.

$P(0 < z < 0.95)$

Exercise 4: Probability

Using the standard normal distribution find the probability that a randomly selected standardized value from a normally distributed variable is between 0 and 0.95.
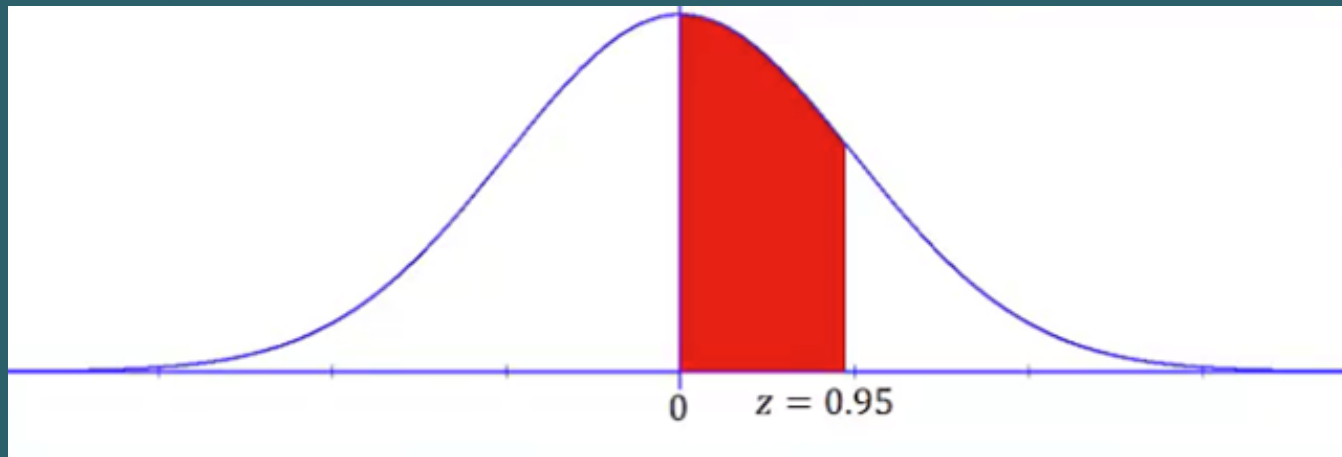

$P(0 < z < 0.95)$

Answer:

$P(0 < z < 0.95) = 0.8289 - 0.5 = \mathbf{0.3289}$

Exercise 4: Probability

This can also be described as finding the area under the normal curve between the mean and 0.95 standard deviations to the right of the mean.

Exercise 4: Probability

The cumulative standard normal distribution table gives us probabilities associated with z-scores. We are looking for the probability associated with the z-score 0.95. We will find the entry in the table where the row 0.9 intersects with the column .05.

z	.00	.01	.02	.03	.04	.05	.06	.07	.08	.09

Cumulative Standard Normal Distribution
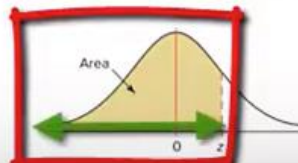

For z values greater than 3.49, use 0.9999.

We find this value to be 0.8289

Exercise 4: Probability

The graph at the bottom of the table shows that these 4 decimal place values in the body of the table correspond to the area under the curve that extends from the left-tail up to the z-score.

For z values greater than 3.49, use 0.9999.

Exercise 4: Probability

This value 0.8289 corresponds to the area under the curve that extends from the left-tail to the z-score 0.95. Our requested probability asks for the area that extends from the mean or in other words where the z-score is 0 up to the point where the z-score is 0.95.
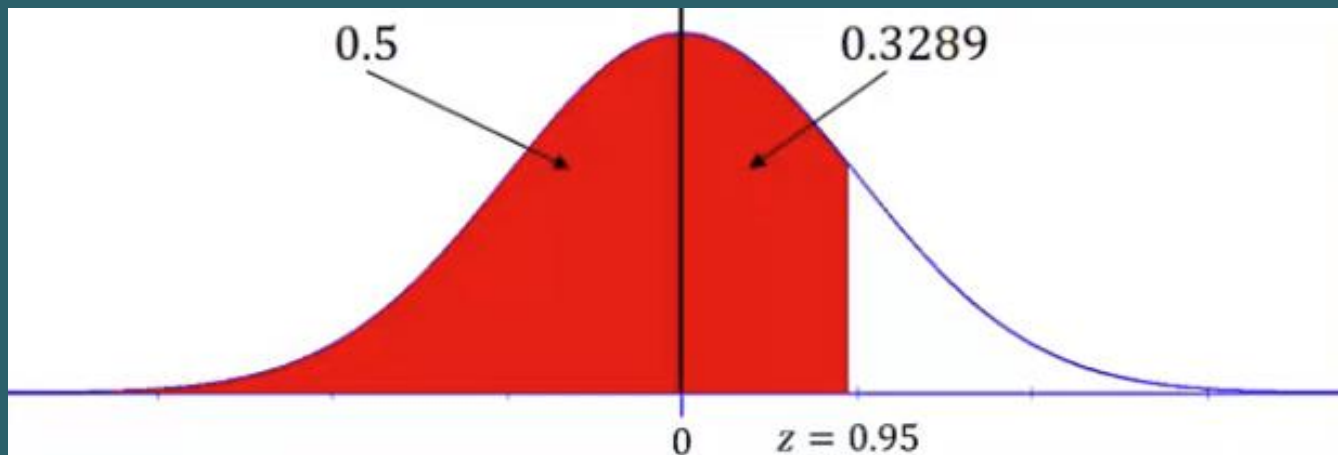

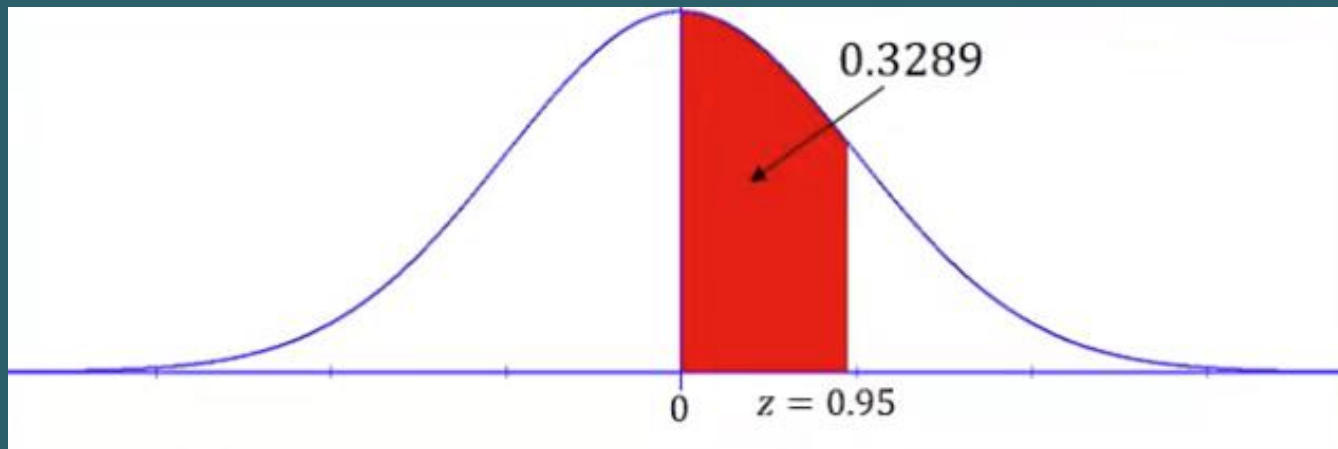

Exercise 4: Probability

The area under the normal curve from the left-tail up to the mean where the z-score is 0 is 0.5 or in other words half of the distribution.
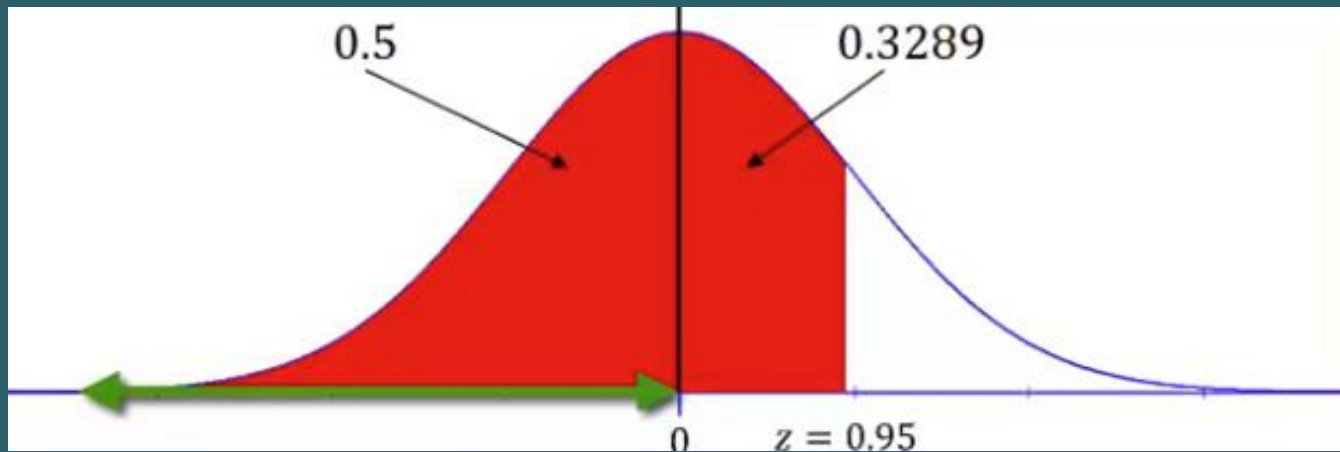

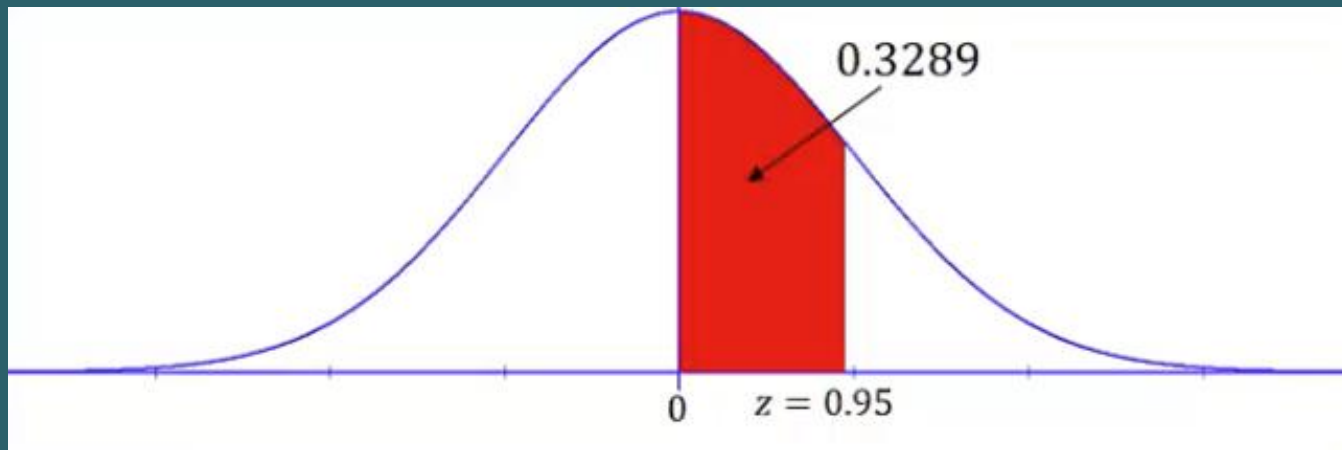

Exercise 4: Probability

That would leave 0.3289 as the area under the curve from the mean where the z-score is equal to 0 up to that point where the z-score is 0.95. The area that we are looking for is 0.3289.

Exercise 4: Probability

In probability notation we would write the probability that z is between 0 and 0.95 is equal to 0.8289 minus 0.5 is equal to 0.3289.

$$P(0 < z < 0.95) = 0.8289 - 0.5 = 0.3289$$

Exercise 5: Probability

Using the standard normal distribution find the probability that a randomly selected standardized value from a normally distributed variable is greater than 2.33.

$$P(z > 2.33)$$

Exercise 5: Probability

Using the standard normal distribution find the probability that a randomly selected standardized value from a normally distributed variable is greater than 2.33.

$$P(z > 2.33)$$

Answer:

$$P(z > 2.33) = 1 - 0.9901 = \mathbf{0.0099}$$

Exercise 5: Probability

This can also be described as finding the area under the normal curve above 2.33 standard deviations to the right of the mean.
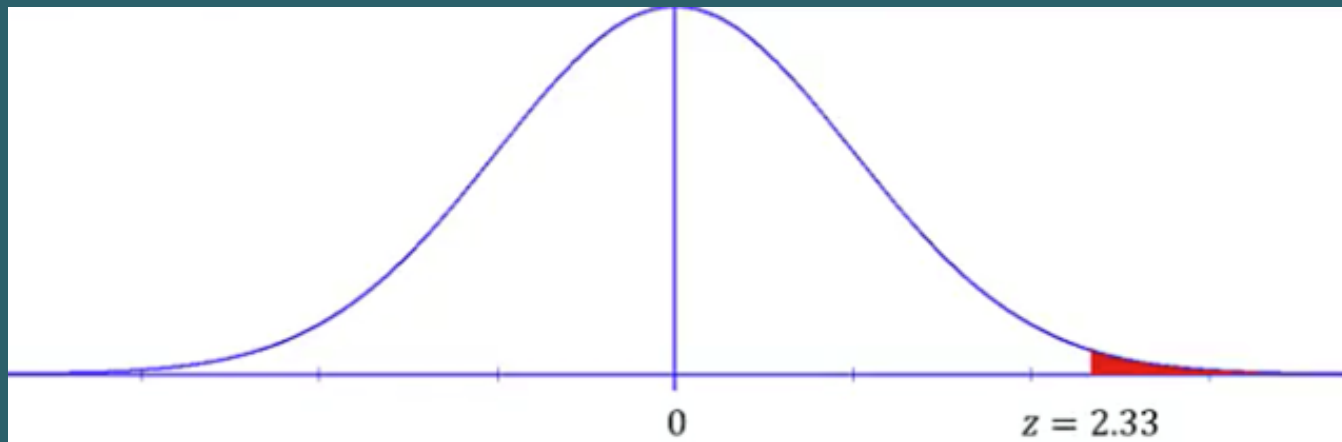

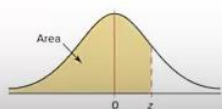

Exercise 5: Probability

The cumulative standard normal distribution table gives us probabilities associated with z-scores. We are looking for the probability associated with the z-score 2.33. We will find the entry in the table where the row 2.3 intersects with the column .03

Cumulative Standard Normal Distribution

or z values greater than 3.49, use 0.9999.

Exercise 5: Probability

$$P(z > 2.33) = 1 - 0.9901 = 0.0099$$

Exercise 6: Probability

Using the standard normal distribution find the probability that a randomly selected standardized value from a normally distributed variable is less than -1.51.
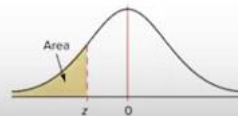

$P(z < -1.51)$

Exercise 6: Probability

Using the standard normal distribution find the probability that a randomly selected standardized value from a normally distributed variable is less than -1.51.

$P(z < -1.51)$

Answer:

$P(z < -1.51) = \mathbf{0.0655}$

Exercise 6: Probability

The cumulative standard normal distribution table gives us probabilities associated with z-scores. We are looking for the probability associated with the z-score -1.51. We will find the entry in the table where the row -1.5 intersects with the column .01

For z values less than −3.49, use 0.0001.

We find this value to be point **0.0655**

Exercise 6: Probability

This value 0.0655 would correspond to the area under the curve that extends from the left-tail up to the z-value -1.51.

$$P(z < -1.51) = \mathbf{0.0655}$$
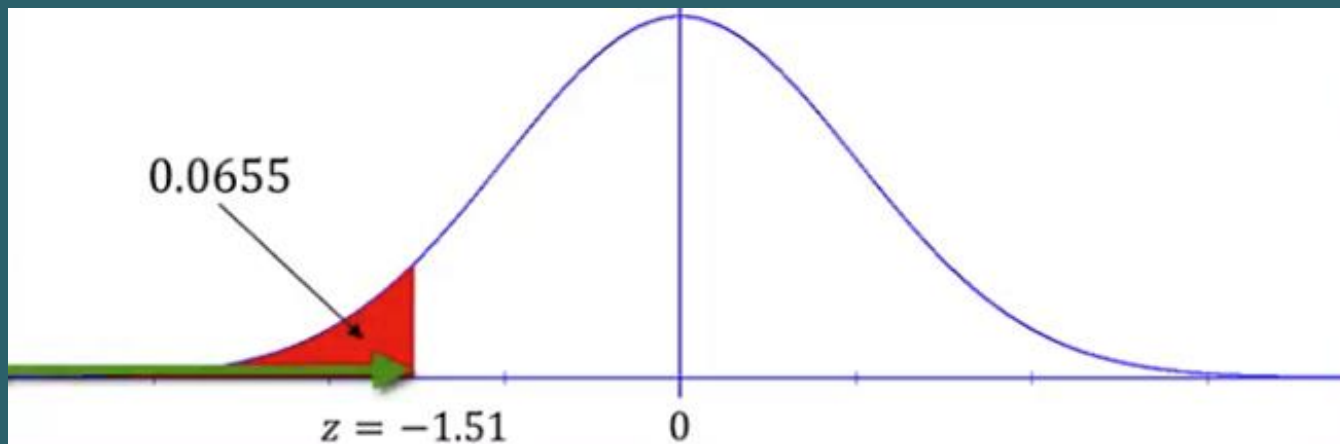

Exercise 7

According to Phys.org, the average fuel economy of vehicles in the US in 2015 was 24.8 mpg. Assume that vehicle fuel economy in the US is normally distributed with a standard deviation of 4.6. Find the probability that a randomly selected vehicle in the US would be rated for fuel economy that is between 15 and 33 mpg.

Exercise 7

According to Phys.org, the average fuel economy of vehicles in the US in 2015 was 24.8 mpg. Assume that vehicle fuel economy in the US is normally distributed with a standard deviation of 4.6. Find the probability that a randomly selected vehicle in the US would be rated for fuel economy that is between 15 and 33 mpg.

Answer:

The probability that a randomly selected vehicle in the US would be rated for fuel economy that is between 15 and 33 miles per gallon would be **0.9459** (or **94.59%**).

Find z-score

In order to find this probability we will first have to find the z-scores for these values of the random variable.

$$z = \frac{X - \mu}{\sigma}$$

$$z = \frac{15 - 24.8}{4.6} = -2.13$$

$$z = \frac{33 - 24.8}{4.6} = 1.78$$

Area Under the Curve

We are to find the probability that a randomly selected value of the random variable would be between those two values. In other words we are looking for this area under the standard normal distribution.
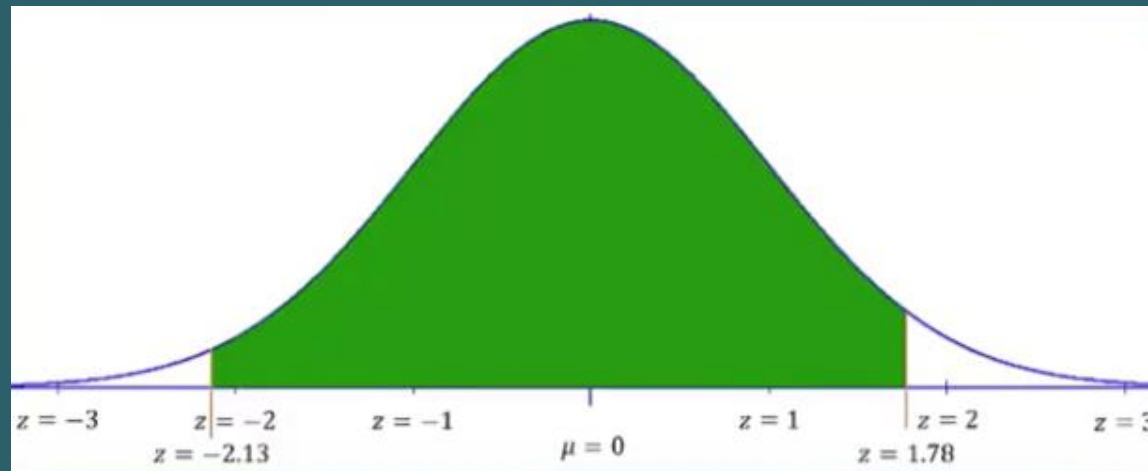

Find area Corresponding to z=-2.13 (=0.0166)
